NOTATION

(The following list of acronyms and abbreviations and units of measure is a duplication of the list in the main portion of the GTCC EIS and is provided here for the convenience of the reader.)

ACRONYMS AND ABBREVIATIONS

ACHP	Advisory Council on Historic Preservation
AEA	Atomic Energy Act of 1954
AEC	U.S. Atomic Energy Commission
AIP	Agreement in Principle
AIRFA	American Indian Religious Freedom Act of 1978
ALARA	as low as reasonably achievable
AMC	activated metal canister
AMWTP	Advanced Mixed Waste Treatment Project
ANOI	Advanced Notice of Intent
AQRV	air-quality-related value
ARP	Actinide Removal Process
ATR	Advanced Test Reactor (INL)
bgs	below ground surface
BLM	Bureau of Land Management
BLS	Bureau of Labor Statistics
BNSF	Burlington Northern Santa Fe
BRCA	Blue Ribbon Commission on America's Nuclear Future
BSL	Biosafety Level
BWR	boiling water reactor
CAA	Clean Air Act
CAAA	Clean Air Act Amendments
CAP88-PC	Clean Air Act Assessment Package 1988-Personal Computer (code)
CCDF	complementary cumulative distribution function
CEDE	committed effective dose equivalent
CEQ	Council on Environmental Quality
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CFA	Central Facilities Area (INL)
CFR	<i>Code of Federal Regulations</i>
CGTO	Consolidated Group of Tribes and Organizations
CH	contact-handled
CRMD	Cultural Resource Management Office
CTUIR	Confederated Tribes of the Umatilla Indian Reservation
CWA	Clean Water Act
CX	Categorical Exclusion

1	DCF	dose conversion factor
2	DCG	derived concentration guide
3	DOE	U.S. Department of Energy
4	DOE-EM	DOE-Office of Environmental Management
5	DOE-ID	DOE-Idaho Operations Office
6	DOE-NV	DOE-Nevada Operations Office
7	DOE-RL	DOE-Richland Operations Office
8	DOI	U.S. Department of the Interior
9	DOT	U.S. Department of Transportation
10	DRZ	disturbed rock zone
11	DTRA	Defense Threat Reduction Agency
12	DWPF	Defense Waste Processing Facility
13		
14	EAC	Early Action Area
15	EDE	effective dose equivalent
16	EDNA	Environmental Designation for Noise Abatement
17	EIS	environmental impact statement
18	EPA	U.S. Environmental Protection Agency
19	ERDF	Environmental Restoration Dispersal Facility
20	ESA	Endangered Species Act of 1973
21	ESRP	Eastern Snake River Plain (INL)
22		
23	FFTF	Fast Flux Test Facility (Hanford)
24	FGR	Federal Guidance Report
25	FONSI	Finding of No Significant Impact
26	FR	<i>Federal Register</i>
27	FTE	full-time equivalent
28	FY	fiscal year
29		
30	GAO	U.S. Government Accountability (formerly General Accounting) Office
31	GMS/OSRP	Office of Global Material Security/Off-Site Source Recovery Project
32	GSA	General Separations Area (SRS)
33	GTCC	greater-than-Class C
34		
35	HAP	hazardous air pollutant
36	HC	Hazard Category
37	HEPA	high-efficiency particulate air
38	HEU	highly enriched uranium
39	HF	hydrogen fluoride
40	HFIR	High Flux Isotope Reactor (ORNL)
41	HMS	Hanford Meteorology Station
42	HOSS	hardened on-site storage
43	h-SAMC	half-shielded activated metal canister
44	HSW EIS	Final Hanford Site Solid (Radioactive and Hazardous) Waste Program Environmental Impact Statement
45		
46		
47		

1	ICRP	International Commission on Radiological Protection
2	IDA	intentional destructive act
3	IDAPA	Idaho Administrative Procedures Act
4	IDEQ	Idaho Department of Environmental Quality
5	IDF	Integrated Disposal Facility
6	INL	Idaho National Laboratory
7	INTEC	Idaho Nuclear Technology and Engineering Center (INL)
8	ISFSI	independent spent fuel storage installation
9		
10	LANL	Los Alamos National Laboratory
11	LCF	latent cancer fatality
12	L _{dn}	day-night sound level
13	L _{eq}	equivalent-continuous sound level
14	LEU	low-enriched uranium
15	LLRW	low-level radioactive waste
16	LLRWPAA	Low-Level Radioactive Waste Policy Amendments Act of 1985
17	LMP	Land Management Plan (WIPP)
18	LWA	Land Withdrawal Act (WIPP)
19	LWB	Land Withdrawal Boundary (WIPP)
20		
21	MCL	maximum contaminant level
22	MCU	modular caustic side solvent extraction unit
23	MDA	material disposal area (LANL)
24	MOA	Memorandum of Agreement
25	MOU	Memorandum of Understanding
26	MOX	mixed oxides
27	MPSSZ	Middleton Place-Summerville Seismic Zone
28	MSL	mean sea level
29		
30	NAAQS	National Ambient Air Quality Standard(s)
31	NAGPRA	Native American Graves Protection and Repatriation Act of 1990
32	NASA	National Aeronautics and Space Administration
33	NCRP	National Council on Radiation Protection and Measurements
34	NDA	NRC-licensed disposal area (West Valley Site)
35	NEPA	National Environmental Policy Act of 1969
36	NERP	National Environmental Research Park
37	NESHAP	National Emission Standard for Hazardous Air Pollutants
38	NHPA	National Historic Preservation Act
39	NI PEIS	Nuclear Isotope PEIS
40	NLVF	North Las Vegas Facility
41	NMAC	<i>New Mexico Administrative Code</i>
42	NMED	New Mexico Environment Department
43	NMFS	National Marine Fisheries Services
44	NNHP	Nevada Natural Heritage Program
45	NNSA	National Nuclear Security Administration (DOE)

3 Table J.3-3 tabulates all individuals who submitted comments via the CREDO Campaign
 4 form letter along with the comment document identifiers assigned to each. One representative
 5 letter (Barber, Kristen, Comment Document ID No. L213) was used to identify the comment.
 6 The comment is identified in brackets on the left side of the page, and the corresponding
 7 response is shown on the right side of the same page. All other comment letters resemble the
 8 representative letter. The representative letter, comment identified in that letter, response, and all
 9 the other comment documents received for this campaign are presented here in Section J.3.3 on
 10 pages J-1767 through J-1827, as indicated in the table. It may be helpful for readers to review
 11 Section J.2 for an overview of the 10 Topics of Interest of this CRD.

Letter One
CitizenLetter

An urgent message from a concerned citizen.

May 14, 2011

DOE Secretary Steven Chu
 US Department of Energy
 1000 Independence Ave SW
 Washington, DC 20585

Dear DOE Secretary Steven Chu,

The earthquake and tsunami in Japan -- and subsequent meltdown at the Fukushima nuclear plant -- are a worrying reminder of the threat posed by all nuclear facilities.

One of the most dangerous in the U.S. is Hanford, which a former Hanford engineer called "a ticking time bomb."

I'm writing to demand that you halt Dept. of Energy plans to truck more nuclear waste to Hanford, clean up what's there, and take action to ensure the site does not threaten the Columbia River and the people who live nearby.

As you know, Hanford is the most contaminated nuclear site in the Western hemisphere. It has 58 million gallons of radioactive sludge stored in leaky underground tanks within dangerous proximity of the Columbia River.

The promised cleanup at Hanford has still not begun in earnest and yet your department proposes to dump even more waste here. The people of Washington have had enough.

Please let me know how you intend to address this issue.

Sincerely,

Kristin Barber

CREDO | www.credo.org

L213-1 DOE's ROD 78 FR 75913 dated December 13, 2013, stated that DOE has deferred a decision on importing waste from other DOE sites (with limited exceptions as described in the Settlement Agreement with Ecology) for disposal at Hanford at least until WTP is operational. For information on DOE's preferred alternative see GTCC EIS Chapter 2.

The earthquake and tsunami in Japan -- and subsequent meltdown at the Fukushima nuclear plant -- are a worrying reminder of the threat posed by all nuclear facilities.

One of the most dangerous in the U.S. is Hanford, which a former Hanford engineer called "a ticking time bomb."

I'm writing to demand that you halt Dept. of Energy plans to truck more nuclear waste to Hanford, clean up what's there, and take action to ensure the site does not threaten the Columbia River and the people who live nearby.

As you know, Hanford is the most contaminated nuclear site in the Western hemisphere. It has 58 million gallons of radioactive sludge stored in leaky underground tanks within dangerous proximity of the Columbia River.

The promised cleanup at Hanford has still not begun in earnest and yet your department proposes to dump even more waste here. The people of Washington have had enough.

Please let me know how you intend to address this issue.

Sincerely,
Llory Boynton

Washington, DC 20585

Dear DOE Secretary Steven Chu,

The earthquake and tsunami in Japan -- and subsequent meltdown at the Fukushima nuclear plant -- are a worrying reminder of the threat posed by all nuclear facilities.

One of the most dangerous in the U.S. is Hanford, which a former Hanford engineer called "a ticking time bomb."

I'm writing to demand that you halt Dept. of Energy plans to truck more nuclear waste to Hanford; clean up what's there, and take action to ensure the site does not threaten the Columbia River and the people who live nearby.

As you know, Hanford is the most contaminated nuclear site in the Western hemisphere. It has 58 million gallons of radioactive sludge stored in leaky underground tanks within dangerous proximity of the Columbia River.

The promised cleanup at Hanford has still not begun in earnest and yet your department proposes to dump even more waste here. The people of Washington have had enough.

Please let me know how you intend to address this issue.

Sincerely,
John Magnuson

CitizenLetter

May 14, 2011

DOE Secretary Steven Chu
US Department of Energy
1000 Independence Ave SW
Washington, DC 20585

Dear DOE Secretary Steven Chu,

The earthquake and tsunami in Japan -- and subsequent meltdown at the Fukushima nuclear plant -- are a worrying reminder of the threat posed by all nuclear facilities.

One of the most dangerous in the U.S. is Hanford, which a former Hanford engineer called "a ticking time bomb."

I'm writing to demand that you halt Dept. of Energy plans to truck more nuclear waste to Hanford, clean up what's there, and take action to ensure the site does not threaten the Columbia River and the people who live nearby.

As you know, Hanford is the most contaminated nuclear site in the Western hemisphere. It has 68 million gallons of radioactive sludge stored in leaky underground tanks within dangerous proximity of the Columbia River.

The promised cleanup at Hanford has still not begun in earnest and yet your department proposes to dump even more waste here. The people of Washington have had enough.

Please let me know how you intend to address this issue.

Sincerely,

March Twisdale

Mr. Arnold M. Edelman, EIS Document Manager
U.S. Department of Energy
GTCC EIS
Cloverleaf Building, EM-43
1000 Independence Ave., S.W.
Washington, D.C. 20585

RE: Comments on the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class-C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D)

Dear Mr. Edelman:

I strongly oppose consideration of any site in New Mexico for the disposal of any of the 160,000,000 curies of commercial GTCC waste. There are not suitable sites in New Mexico for disposal of this waste. Nor is there any need for New Mexico sites to be considered because the wastes should be stored and disposed at sites at or near the commercial reactors that produce approximately 98 percent of the radioactivity in GTCC waste.

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

I believe that you should stop this flawed process and not issue a final environmental impact statement (EIS). The new EIS should not consider any sites in New Mexico as reasonable alternatives and instead should examine alternative commercial sites. The new EIS also should consider Hardened On-Site Storage as a long-term storage option until there are suitable disposal sites.

Thank you for your consideration of my comments.

Yours truly,

Name: Chris Abrahamsen
Address: 710 W. Mission San Diego
92120, CA, SAN DIEGO
Email: _____

L13-1

DOE acknowledges that only defense-generated TRU waste is currently authorized for disposal at the WIPP geologic repository under the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and that legislation would be required to allow disposal of waste other than TRU waste generated by atomic energy defense activities at WIPP and/or for siting a new facility within the land withdrawal area. However, NEPA does not limit an EIS to proposing and evaluating alternatives that are currently authorized. The Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant recognizes that the mission of WIPP may change and provides provisions to modify the agreement. For example, the Agreement states: "The parties to this Agreement recognize that future developments including changes to applicable laws (e.g., Public Law [P.L.] 96-164) may make it desirable or necessary for one or both parties to seek to modify this Agreement. Either party to this Agreement may request a review of the terms and conditions."

DOE acknowledges the TRU waste disposal limitations for WIPP specified in the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and in the Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant. Information on these limitations is provided in this EIS (see Section 4.1.1) and was considered in developing the preferred alternative. Based on the GTCC EIS evaluation, disposal of GTCC LLRW and GTCC-like wastes at WIPP would result in minimal environmental impacts for all resource areas evaluated, including human health and transportation. Both the annual dose and the latent cancer fatality (LCF) risk would be zero because there would be no releases to the accessible environment and therefore no radiation doses and LCFs during the first 10,000 years following closure of the WIPP repository. In addition to legislative changes, DOE recognizes that the use of WIPP for the disposal of GTCC LLRW and GTCC-like wastes would require and site-specific NEPA reviews, including further characterization of the waste (e.g., radionuclide inventory and heat loads), as well as the proposed packaging for disposal.

L13-1

L13-2

The disposal methods and sites evaluated in the EIS represent the range of reasonable alternatives for the disposal of GTCC LLRW and GTCC-like waste. This range is consistent with NEPA implementing regulations given in Parts 1500–1508 of Title 40 of the Code of Federal Regulations (40 CFR Parts 1500–1508). In this GTCC EIS, DOE analyzed a range of disposal methods (i.e., geologic repository, near-surface trench, intermediate-depth borehole, and above-grade vault) and federally owned sites (i.e., Hanford Site, INL, LANL, NNSS, SRS, and WIPP Vicinity for which two reference locations, one within and one outside the WIPP Land Withdrawal Boundary, were considered). DOE has determined that it was reasonable to analyze only these six sites because they currently have operating radioactive waste disposal facilities, except for the WIPP Vicinity, which is near an operating geologic repository. Although some commenters stated that this range of disposal sites is too narrow, they did not offer specific locations for analysis. It would not be reasonable to analyze in detail an essentially unlimited number of additional non-DOE or nonfederal sites. Nevertheless, DOE also conducted a generic evaluation of commercial disposal facilities on nonfederal lands in the EIS to order to provide, to the extent possible, information regarding the potential long-term performance of other (nonfederal) locations for siting a GTCC waste land disposal facility.

L13-2

The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Under the No Action Alternative, current practices for storing GTCC LLRW and GTCC-like wastes would continue in accordance with current requirements.

RE: Comments on the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class-C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D)

Dear Mr. Edelman:

I strongly oppose consideration of any site in New Mexico for the disposal of any of the 160,000,000 curies of commercial GTCC waste. There are not suitable sites in New Mexico for disposal of this waste. Nor is there any need for New Mexico sites to be considered because the wastes should be stored and disposed at sites at or near the commercial reactors that produce approximately 98 percent of the radioactivity in GTCC waste.

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

I believe that you should stop this flawed process and not issue a final environmental impact statement (EIS). The new EIS should not consider any sites in New Mexico as reasonable alternatives and instead should examine alternative commercial sites. The new EIS also should consider Hardened On-Site Storage as a long-term storage option until there are suitable disposal sites.

Thank you for your consideration of my comments.

Yours truly,

RE: Comments on the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class-C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D)

Dear Mr. Edelman:

I strongly oppose consideration of any site in New Mexico for the disposal of any of the 160,000,000 curies of commercial GTCC waste. There are not suitable sites in New Mexico for disposal of this waste.. Nor is there any need for New Mexico sites to be considered because the wastes should be stored and disposed at sites at or near the commercial reactors that produce approximately 98 percent of the radioactivity in GTCC waste.

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

I believe that you should stop this flawed process and not issue a final environmental impact statement (EIS). The new EIS should not consider any sites in New Mexico as reasonable alternatives and instead should examine alternative commercial sites. The new EIS also should consider Hardened On-Site Storage as a long-term storage option until there are suitable disposal sites.

Thank you for your consideration of my comments.

Yours truly,

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

I believe that you should stop this flawed process and not issue a final environmental impact statement (EIS). The new EIS should not consider any sites in New Mexico as reasonable alternatives and instead should examine alternative commercial sites. The new EIS also should consider Hardened On-Site Storage as a long-term storage option until there are suitable disposal sites.

Thank you for your consideration of my comments.

RE: Comments on the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class-C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D)

Dear Mr. Edelman:

I strongly oppose consideration of any site in New Mexico for the disposal of any of the 160,000,000 curies of commercial GTCC waste. There are not suitable sites in New Mexico for disposal of this waste. Nor is there any need for New Mexico sites to be considered because the wastes should be stored and disposed at sites at or near the commercial reactors that produce approximately 98 percent of the radioactivity in GTCC waste.

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

Nor is there any need for New Mexico sites to be considered because the wastes should be stored and disposed at sites at or near the commercial reactors that produce approximately 98 percent of the radioactivity in GTCC waste.

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

I believe that you should stop this flawed process and not issue a final environmental impact statement (EIS). The new EIS should not consider any sites in New Mexico as reasonable alternatives and instead should examine alternative commercial sites. The new EIS also should consider Hardened On-Site Storage as a long-term storage option until there are suitable disposal sites.

Thank you for your consideration of my comments.

Yours truly,

RE: Comments on the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class-C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D)

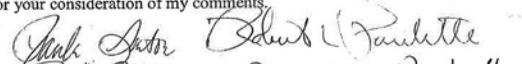

Dear Mr. Edelman:

I strongly oppose consideration of any site in New Mexico for the disposal of any of the 160,000,000 curies of commercial GTCC waste. There are not suitable sites in New Mexico for disposal of this waste. Nor is there any need for New Mexico sites to be considered because the wastes should be stored and disposed at sites at or near the commercial reactors that produce approximately 98 percent of the radioactivity in GTCC waste.

The people of New Mexico were promised on numerous occasions that the Waste Isolation Pilot Plant (WIPP) would be for defense, not commercial, waste. The WIPP Land Withdrawal Act prohibits any commercial waste at WIPP. Any site at or near WIPP also is inappropriate because it would be an attempt to circumvent that prohibition. Los Alamos National Laboratory (LANL) has thousands of cubic meters of waste that must be cleaned up, and it is totally inappropriate to bring any commercial waste to LANL for disposal. New Mexico also has millions of tons of waste from uranium mining and milling. Thus, New Mexicans are already burdened with more than our share of the nation's nuclear waste.

I believe that you should stop this flawed process and not issue a final environmental impact statement (EIS).  Re: Draft EIS on Greater-than-Class-C radioactive waste disposal

The DOE is considering how to dispose of 160 million curies of Greater-than-Class-C (GTCC) radioactive waste. Nearly all this waste is from current and projected commercial sources. But the six sites considered in this draft EIS all belong to the federal government, and the DOE's study does not even try to prove they are best for GTCC disposal based on objective criteria. Of all the arid sites, the Idaho National Laboratory would have the highest potential long-term human health impacts because of exposure through contaminated groundwater. That is *not* acceptable. The DOE should write a new draft EIS that includes hardened-on-site-storage at commercial reactor sites.

 Re: Draft EIS on Greater-than-Class-C radioactive waste disposal

The Department of Energy (DOE) is considering how to dispose of 160 million curies of Greater-than-Class-C (GTCC) radioactive waste. Nearly all this waste is from current and projected commercial sources. But the six sites specifically considered in this draft EIS are all controlled by the federal government, and the DOE's study does not even attempt to assert that these sites are the best choices for GTCC disposal based on objective criteria. Of all the arid DOE sites, the Idaho National Laboratory would have the highest potential long-term human health impacts because of exposure through radioactively contaminated groundwater. That is *not* acceptable. The DOE should write a new draft EIS that includes consideration of hardened on-site storage of GTCC waste at the commercial reactor sites where it is produced.

From: *Miranda Adams*
 mirandaadams@hotmail.com

L176-1

Consistent with NEPA implementing regulations in Parts 1500–1508 of Title 40 of the Code of Federal Regulations (40 CFR Parts 1500–1508), DOE analyzed a range of disposal methods (i.e., geologic repository, near-surface trench, intermediate-depth borehole, and above-grade vault) and federally owned sites (i.e., Hanford Site, INL, LANL, NNSS, SRS, WIPP, and the WIPP Vicinity) as well as generic commercial locations. DOE determined that it was reasonable to analyze the federal sites because they currently have operating radioactive waste disposal facilities, except for the WIPP Vicinity, which is near an operating geologic repository.

Final siting of a disposal facility for GTCC LLRW and GTCC-like wastes would involve further NEPA review as appropriate and be in accordance with applicable laws and regulations and would include local stakeholder and tribal government involvement.

L176-2

The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Under the No Action Alternative, current practices for storing GTCC LLRW and GTCC-like wastes would continue in accordance with current requirements.

 Re: Draft EIS on Greater-than-Class-C radioactive waste disposal

The Department of Energy (DOE) is considering how to dispose of 160 million curies of Greater-than-Class-C (GTCC) radioactive waste. Nearly all this waste is from current and projected commercial sources. The only deep geologic repository the DOE analyzes WIPP in New Mexico. But WIPP was opened with a promise to the people of New Mexico that it would be used *solely* for waste from nuclear weapons production. Commercial waste is specifically prohibited. The federal government can't now tell New Mexicans: "You took the nose, now take the camel." To do so would show every other community asked to host a permanent repository in the future that they might well get more than they bargained for and make repository siting more difficult. The DOE should write a new draft EIS that includes consideration of hardened on-site storage of GTCC waste at the commercial reactor sites where it is produced and does not consider legally barred disposal.

L130-1

DOE acknowledges that only defense-generated TRU waste is currently authorized for disposal at the WIPP geologic repository under the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and that legislation would be required to allow disposal of waste other than TRU waste generated by atomic energy defense activities at WIPP and/or for siting a new facility within the land withdrawal area. However, NEPA does not limit an EIS to proposing and evaluating alternatives that are currently authorized. The Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant recognizes that the mission of WIPP may change and provides provisions to modify the agreement. For example, the Agreement states: "The parties to this Agreement recognize that future developments including changes to applicable laws (e.g., Public Law [P.L.] 96-164) may make it desirable or necessary for one or both parties to seek to modify this Agreement. Either party to this Agreement may request a review of the terms and conditions."

DOE acknowledges the TRU waste disposal limitations for WIPP specified in the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and in the Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant. Information on these limitations is provided in this EIS (see Section 4.1.1) and was considered in developing the preferred alternative. Based on the GTCC EIS evaluation, disposal of GTCC LLRW and GTCC-like wastes at WIPP would result in minimal environmental impacts for all resource areas evaluated, including human health and transportation. Both the annual dose and the latent cancer fatality (LCF) risk would be zero because there would be no releases to the accessible environment and therefore no radiation doses and LCFs during the first 10,000 years following closure of the WIPP repository. In addition to legislative changes, DOE recognizes that the use of WIPP for the disposal of GTCC LLRW and GTCC-like wastes would require and site-specific NEPA reviews, including further characterization of the waste (e.g., radionuclide inventory and heat loads), as well as the proposed packaging for disposal.

L130-2

The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Nearly all this waste is from current and projected commercial sources. But the six sites specifically considered in this draft EIS are all controlled by the federal government, and the DOE's study does not even attempt to assert that these sites are the best choices for GTCC disposal based on objective criteria. Of all the arid DOE sites, the Idaho National Laboratory would have the highest potential long-term human health impacts because of exposure through radioactively contaminated groundwater. That is *not* acceptable. The DOE should write a new draft EIS that includes consideration of hardened on-site storage of GTCC waste at the commercial reactor sites where it is produced.

The only deep geologic repository the DOE analyzes is WIPP in New Mexico. But the people of New Mexico were promised that WIPP would be used *solely* for waste from nuclear weapons production. The federal government can't now tell New Mexicans: "You took the nose, now take the camel." To do so would show every other community asked to host a permanent repository in the future that they might well get more than they bargained for and make repository siting more difficult. The DOE should write a new draft EIS that includes consideration of hardened on-site storage of GTCC waste at the commercial reactor sites where it is produced.

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E65-1 | The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Under the No Action Alternative, current practices for storing GTCC LLRW and GTCC-like wastes would continue in accordance with current requirements. |
| E65-2 | Stopping the generation of nuclear waste or promoting alternative energy sources is outside the scope of the GTCC EIS, the scope of which is to evaluate disposal alternatives to enable the selection of a safe alternative or alternatives for the disposal of GTCC LLRW and GTCC-like wastes. |
| E65-3 | The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Under the No Action Alternative, current practices for storing GTCC LLRW and GTCC-like wastes would continue in accordance with current requirements. |
| E65-4 | The Secretary of Energy determined that a permanent repository for high-level waste and spent nuclear fuel at Yucca Mountain, Nevada, is not a workable option and will not be developed. Therefore, DOE concluded that co-disposal at a Yucca Mountain repository is not a reasonable alternative and has eliminated it from evaluation in this EIS, as described in Section 2.6 of the EIS. DOE did not evaluate developing a repository exclusively for disposal of GTCC LLRW and GTCC-like wastes because DOE determined that such an alternative is unreasonable due to the time and cost associated with siting another deep geologic repository and the relatively small volume of GTCC LLRW and GTCC-like waste identified in the GTCC EIS. DOE believes that the results presented in this EIS for the WIPP geologic repository alternative are indicative of the high degree of waste isolation that would be provided by the use of this disposal method. |
| E65-5 | DOE recognizes that the use of WIPP for disposal of GTCC waste would require federal legislation to modify the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240). In addition, it may be necessary to revise the Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant, the WIPP compliance certification with the EPA, and the WIPP Hazardous Waste Facility Permit. |

E65-4

E65-5

(Representative Letter version a)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Finally, suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Mary Lou Anderson
 4584 CASA MIA CIR
 LAS VEGAS, NV 89121-5407
 7025727249

2

The No Action Alternative is evaluated in the EIS to provide a baseline for comparison with the action alternatives. This evaluation confirmed the risks posed by these wastes and the need to develop appropriate disposal capability. The potential radiation doses for the No Action Alternative covered a time period of 10,000 years in a manner comparable to that done for the action alternatives. Relatively high impacts could occur shortly after the 100-year institutional control period under this alternative.

|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E65-5
(Cont.) | E65-5

DOE initiated consultation and communication with the 14 participating American Indian tribes that have cultural or historical ties to the DOE sites analyzed in the EIS. These interactions are summarized in Section 1.8 of the EIS, and they included several meetings, workshops, and the development of tribal narratives that were included in the EIS. In addition to including tribal narratives related to the four sites in the EIS, DOE inquired about tribal interest with regard to the WIPP/WIPP Vicinity and SRS. No tribes came forward in response to the inquiries regarding these two locations. It was not necessary to consult with American Indian tribes with regard to the generic regional locations, since the specific locations of the potential disposal facilities (and the affected tribes) were not known. |
| E65-6 | E65-6

The Low-Level Radioactive Waste Policy Amendments Act (LLRWPA, P.L. 99-240) assigns DOE responsibility for the disposal of GTCC LLRW generated by NRC and Agreement State licensees. The LLRWPA (P.L. 99-240) does not limit DOE to using only non-DOE facilities or sites for GTCC LLRW disposal. |
| E65-7 | E65-7

The LLRWPA (P.L. 99-240) specifies that GTCC LLRW is to be disposed of in an NRC-licensed facility that has been determined to be adequate to protect public health and safety. There are currently no NRC-licensed facilities that are authorized to dispose of GTCC LLRW. Unless specifically provided by law, the NRC does not have authority to license and regulate facilities operated by or on behalf of DOE. While DOE does not believe the LLRWPA (P.L. 99-240) requires DOE to only consider commercial disposal alternatives, DOE does recognize that legislation may be needed to clarify whether a GTCC LLRW disposal facility owned or operated by or on behalf of DOE must be licensed by the NRC, and if so, to authorize the NRC to license such a facility. |
| E65-8 | E65-7

DOE/NNSA analyzed various radioactive waste shipping routes through and around metropolitan Las Vegas, Nevada, in the Draft NNSS SWEIS. DOE/NNSA continued discussions with the State of Nevada on routing options throughout the preparation of the Final NNSS SWEIS. After taking into consideration the comments and concerns expressed by State, county, and local government officials and the public in general during the review and comment period for the Draft NNSS SWEIS, DOE/NNSA decided to maintain the current highway routing restrictions for shipments of low-level radioactive waste (LLW) and mixed-low level radioactive waste (MLLW), as described in the Waste Acceptance Criteria (WAC) for the site. DOE/NNSA explained this decision in the Final NNSS SWEIS. The unchanged WAC restrictions are to avoid (1) crossing the Colorado River near Hoover Dam and (2) the greater metropolitan Las Vegas interstate system. DOE/NNSA is not considering, nor is it making, changes to the NNSS WAC with regard to routing. |
| E65-8 | E65-8

The scope of this EIS is adequate to inform decision making for the disposal of GTCC LLRW and GTCC-like waste. Sufficient information is available to support the current decision-making process to identify (an) appropriate site(s) and method(s) to dispose of the limited amount of GTCC wastes identified in the EIS. |
| | DOE believes that this EIS process is not premature and is in compliance with NEPA. On the basis of an assumed starting date of 2019 for disposal operations, more than half (about 6,700 m ³ [240,000 ft ³]) of the total GTCC waste inventory of 12,000 m ³ [420,000 ft ³] is projected to be available for disposal between 2019 and 2030. An additional 2,000 m ³ (71,000 ft ³) would become available for disposal between 2031 and 2035. This information is |

(Representative Letter version a)

presented in Figure 3.4.2-1. DOE believes this EIS is timely, especially given the length of time necessary to select, design, and build a GTCC waste disposal facility.

DOE developed this EIS to support a decision on selecting a disposal facility or facilities for GTCC LLRW and GTCC-like waste, to address legislative requirements, to address national security concerns (especially for sealed sources), and to protect public health and safety. The purpose and need for the proposed action, as discussed above, is stated in the EIS (Section 1.1). The scope of the EIS is focused on addressing the need for developing a disposal capability for the identified inventory of GTCC LLRW and GTCC-like waste. DOE plans a tiered decision-making process in which DOE would conduct further site-specific NEPA reviews before implementing an alternative ultimately selected on the basis of this EIS.

Please do not send all that waste to WIPP. Wipp is only for Low Level waste! Thank you.

General Recommendations

- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.
- DOE should develop a national waste management strategy to address these waste types.
 - "GTCC-like" waste is not subject to the NRC requirements for geologic disposal. DOE should issue a supplement to its 1997 Final Waste Management Environmental Impact Statement to look at the reasonable alternatives for "GTCC-like" waste and other wastes for which long-term storage and disposal is not determined.
 - Such a strategy is needed to integrate the management of these wastes as opposed to the apparent piecemeal approach that is currently being used by the Department.
 - Such a strategy, moreover, should be assessed through a programmatic and site-specific NEPA process that addresses major federal actions that could significantly affect the quality of the human environment. This is particularly important when considering the disposal of long-lived radioactive wastes, which are not suitable for shallow land burial.
- Current regulations say that GTCC wastes should be disposed in a geologic repository. Examine a second repository. The legal requirement for another repository exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- Rather than an alternative repository, the EIS proposes using near-surface trenches; bore holes, or vaults to dispose of GTCC waste at DOE facilities. All those sites have large amounts of nuclear weapons waste, which will take billions of dollars and decades to clean up, and should not be considered for GTCC waste.

1

Mills, Lorene – E56

E56-1 DOE's ROD 78 FR 75913 dated December 13, 2013, stated that DOE has deferred a decision on importing waste from other DOE sites (with limited exceptions as described in the Settlement Agreement with Ecology) for disposal at Hanford at least until WTP is operational. For information on DOE's preferred alternative see GTCC EIS Chapter 2.

E56-2 The EIS considered the range of reasonable alternatives for the disposal of the GTCC waste inventory identified in the EIS. The Secretary of Energy determined that a permanent repository for high-level waste and spent nuclear fuel at Yucca Mountain, Nevada, is not a workable option and will not be developed. Therefore, DOE concluded that co-disposal at a Yucca Mountain repository is not a reasonable alternative and has eliminated it from evaluation in this EIS, as described in Section 2.6 of the EIS.

DOE did not evaluate developing a geologic repository exclusively for disposal of GTCC LLRW and GTCC-like wastes because DOE determined that such an alternative is unreasonable due to the time and cost associated with siting another deep geologic repository and the relatively small volume of GTCC LLRW and GTCC-like waste identified in the GTCC EIS. DOE believes that the results presented in this EIS for the WIPP geologic repository alternative are indicative of the high degree of waste isolation that would be provided by the use of this disposal method.

DOE recognizes that the use of WIPP for disposal of GTCC waste would require federal legislation to modify the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240). In addition, it may be necessary to revise the Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant, the WIPP compliance certification with the EPA, and the WIPP Hazardous Waste Facility Permit.

E56-1

E56-2

Nuclear Watch Campaign
Mills, Lorene, Commenter ID No. E56 (cont'd)
(Representative Letter version b)

- o Prior to issuance of the GTCC EIS, DOE has failed to comply with the requirement of the Nuclear Waste Policy Act of 1982, 42 U.S.C. §10101 et seq., for development of one or more other deep geologic repositories. The Yucca Mountain site has failed as a deep geologic repository and Congress has not authorized a second site to be located.
- o In addition to ignoring regulatory requirements and public comment, the GTCC EIS also disregards the Nuclear Waste Policy Act, which requires DOE to site and operate at least one geologic repository other than WIPP. Since 1987, the only place considered is Yucca Mountain, Nev. That flawed site, always strongly opposed by Nevadans, has been terminated by the Obama administration, and appropriately has been dropped from consideration in the GTCC EIS.
- o The legal requirement for another repository still exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS that includes HOSS facilities as the best solution for GTCC wastes for decades to come and for new geologic disposal site(s) to dispose of GTCC waste.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.
- Finish the original mission at WIPP.
- o Safely operate WIPP to meet the "start clean, stay clean" standard
- o Meet commitments to clean up about 20 DOE nuclear weapons sites
- o Safely close, decontaminate, and decommission the WIPP site, beginning in about 2030 or earlier.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- LANL must focus on existing Consent Order cleanup and not bring any more waste, including Greater-than-Class C (GTCC), to the Lab.
- o Technical Area 54 (TA-54) is the specific location at LANL that the EIS proposes borehole, trench or vault. This very location is the subject of extensive remediation in Material Disposal Areas (MDAs) G, L and H and is scheduled for completion in 2015 under an agreement with the New Mexico Environment Department.
- o This legally binding agreement requires DOE and LANL to investigate and clean up decades worth of contamination across the lab's 40-square-mile property. Signed in 2005, the Consent Order lays out cleanup milestones and requires the federal government to pay fines if LANL fails to meet them.

E56-3 The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Under the No Action Alternative, current practices for storing GTCC LLRW and GTCC-like wastes would continue in accordance with current requirements.

E56-2 (Cont.)

E56-4 DOE acknowledges that only defense-generated TRU waste is currently authorized for disposal at the WIPP geologic repository under the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and legislation would be required to allow disposal of waste other than TRU waste generated by atomic energy defense activities at WIPP and/or for siting a new facility within the land withdrawal area. However, NEPA does not limit an EIS to proposing and evaluating alternatives that are currently authorized. The Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant recognizes that the mission of WIPP may change and provides provisions to modify the agreement. For example, the Agreement states: "The parties to this Agreement recognize that future developments including changes to applicable laws (e.g., Public Law [P.L.] 96-164) may make it desirable or necessary for one or both parties to seek to modify this Agreement. Either party to this Agreement may request a review of the terms and conditions."

E56-3

DOE acknowledges the TRU waste disposal limitations for WIPP specified in the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and in the Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant. Information on these limitations is provided in this EIS (see Section 4.1.1) and was considered in developing the preferred alternative. Based on the GTCC EIS evaluation, disposal of GTCC LLRW and GTCC-like wastes at WIPP would result in minimal environmental impacts for all resource areas evaluated, including human health and transportation. Both the annual dose and the latent cancer fatality (LCF) risk would be zero because there would be no releases to the accessible environment and therefore no radiation doses and LCFs during the first 10,000 years following closure of the WIPP repository. In addition to legislative changes, DOE recognizes that the use of WIPP for the disposal of GTCC LLRW and GTCC-like wastes would require and site-specific NEPA reviews, including further characterization of the waste (e.g., radionuclide inventory and heat loads), as well as the proposed packaging for disposal.

E56-4

E56-5 Consistent with NEPA implementing regulations in Parts 1500–1508 of Title 40 of the Code of Federal Regulations (40 CFR Parts 1500–1508), DOE analyzed a range of disposal methods (i.e., geologic repository, near-surface trench, intermediate-depth borehole, and above-grade vault) and federally owned sites (i.e., Hanford Site, INL, LANL, NNSS, SRS, WIPP, and the WIPP Vicinity) as well as generic commercial locations. DOE determined that it was reasonable to analyze the federal sites because they currently have operating radioactive waste disposal facilities, except for the WIPP Vicinity, which is near an operating geologic repository.

Nuclear Watch Campaign
Mills, Lorene, Commenter ID No. E56 (cont'd)
(Representative Letter version b)

- o The residents of Northern New Mexico expect no less from DOE and LANL than completion of the legacy waste remediation on schedule.
- o To reverse this policy and add new waste will severely jeopardize LANL relations with its neighbors both near and far and negate much of the progress accomplished.
- Heed the American Indian Text
- o Pueblo people believe that plant roots will eventually penetrate the GTCC facility.
- o There is a need for a cultural mineral assessment and study to identify the existence of minerals of cultural significance and use.

E56-6

E56-5
(Cont.)

E56-6

Text prepared by potentially affected American Indian tribes is included in this EIS. DOE considered this text for Hanford, INL, LANL, and NNSS; however, DOE also needed to ensure consistency in the EIS analyses between the various sites, so that an even comparison could be made between alternatives as required by NEPA. Because of this, it was not possible to fully utilize all of the information provided by the tribal governments in order to perform specific analyses associated with exposure events unique to a given American Indian tribe (such as greater intakes of fish, game, and plants; the use of sweat lodges; and the use of natural pigment paints for traditional ceremonies). Once a decision is made on a specific site location and method, site-specific NEPA reviews would be conducted as needed, including appropriate analysis of exposure events unique to the impacted local American Indian tribes.

However, the information provided in these narratives was considered in the identification of the preferred alternative presented in this EIS. The information provided in the narratives for Hanford, INL, LANL, and NNSS was very useful, and DOE appreciates the time and effort expended by the various tribes in supporting this EIS process.

Let me b

June 10, 2011

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000
 Independence Avenue, SW., Washington, DC 20585

General Recommendations

- Hardened On-site Storage (HOSS) must be considered as an alternative.
 - o GTCC waste and irradiated spent fuel would remain on-site at commercial nuclear power plants in long-term storage so that they can be monitored and are protected in hardened storage facilities from aircraft crashes or terrorist attacks. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS.
 - o The DOE rejection of the HOSS alternative is unacceptable because GTCC LLW at present and for decades in the future will be in on-site storage, so the actual status is not outside the scope of alternatives that should be considered for an EIS.
 - o The DEIS rejected the HOSS alternative that many people from around the country advocated at DOE's GTCC scoping meetings in 2007.
 - o HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found. Part of that future solution, of course, should be drastically minimizing the generation of those wastes.
 - o DOE's reason for rejecting HOSS is that it is "not a permanent disposal facility." Yet, most of the GTCC waste will not be generated for many decades.
 - o At least 85 percent of existing reactors and any new ones are expected to operate beyond 2030, which means GTCC waste disposal could not begin for years after that.
 - o Decisions now about disposal sites and technologies are premature. There is time to learn from experience.
 - o DOE must create a regulatory definition of HOSS.

1

Gordon, Susan – E95

J-1963

January 2016

E95-1 The use of HOSS and other approaches for long-term storage of GTCC LLRW and GTCC-like wastes are outside the scope of this EIS because they do not meet the purpose and need for agency action. Consistent with Congressional direction in Section 631 of the Energy Policy Act of 2005 (P.L. 109-58), DOE plans to complete an EIS and a ROD for a permanent disposal facility for this waste, not for long-term storage options. The GTCC EIS evaluates the range of reasonable disposal alternatives and, as also required under NEPA, a No Action Alternative. Under the No Action Alternative, current practices for storing GTCC LLRW and GTCC-like wastes would continue in accordance with current requirements.

The development of a regulatory framework for the use of HOSS at commercial nuclear power plants is outside the scope of the GTCC EIS. DOE does not have authority to regulate the storage of radioactive wastes at commercial facilities, including nuclear power plants. Under the Atomic Energy Act of 1954 as amended (AEA) (see United States Code: 42 USC § 2011), NRC is responsible for regulating storage of such wastes. Radioactive waste storage requirements can be found in 10 CFR Part 30 (Rule of General Applicability to Domestic Licensing of Byproduct Material), 10 CFR Part 70 (Domestic Licensing of Special Nuclear Material), and 10 CFR Part 72 (Licensing Requirements for the Independent Storage of Spent Nuclear Fuel, High-Level Radioactive Waste, and Reactor-Related Greater Than Class C Waste). In addition, NRC has provided guidance for the storage of LLRW in SECY-94-198, Review of Existing Guidance Concerning the Extended Storage of Low-Level Radioactive Waste, which was issued on August 1, 1994.

E95-1

Nuclear Watch Campaign
Gordon, Susan, Commenter ID No. E95 (cont'd)
(Representative Letter version c)

- o DOE must create a regulatory framework for HOSS.
- o HOSS is not a "no action" alternative.
- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- DOE is considering WIPP for GTCC disposal only because WIPP is currently the only hole in the ground. DOE must expand its horizons.
- o Section 1.4.3 of the EIS states, "For deep geologic disposal, WIPP in New Mexico was included for evaluation in this EIS because of its characteristics as a geologic repository."
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- The location of LANL in a seismic fault zone between a rift valley and a dormant volcano is not the place for radioactive waste that is dangerous for tens of thousands of years.

Susan Gordon

E95-2	DOE is performing environmental restoration activities at the Hanford Site, INL, LANL, NNSS, and SRS. The ongoing cleanup efforts at these sites will continue. A GTCC waste disposal facility would be located in an area removed from ongoing cleanup activities, so disposal of the GTCC wastes would not affect ongoing cleanup activities at these sites.
E95-3	DOE acknowledges that only defense-generated TRU waste is currently authorized for disposal at the WIPP geologic repository under the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and legislation would be required to allow disposal of waste other than TRU waste generated by atomic energy defense activities at WIPP and/or for siting a new facility within the land withdrawal area. However, NEPA does not limit an EIS to proposing and evaluating alternatives that are currently authorized. The Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant recognizes that the mission of WIPP may change and provides provisions to modify the agreement. For example, the Agreement states: "The parties to this Agreement recognize that future developments including changes to applicable laws (e.g., Public Law [P.L.] 96-164) may make it desirable or necessary for one or both parties to seek to modify this Agreement. Either party to this Agreement may request a review of the terms and conditions."
E95-2	DOE acknowledges the TRU waste disposal limitations for WIPP specified in the WIPP LWA as amended (P.L. 102-579 as amended by P.L. 240) and in the Agreement for Consultation and Cooperation between Department of Energy and the State of New Mexico for the Waste Isolation Pilot Plant. Information on these limitations is provided in this EIS (see Section 4.1.1) and was considered in developing the preferred alternative. Based on the GTCC EIS evaluation, disposal of GTCC LLRW and GTCC-like wastes at WIPP would result in minimal environmental impacts for all resource areas evaluated, including human health and transportation. Both the annual dose and the latent cancer fatality (LCF) risk would be zero because there would be no releases to the accessible environment and therefore no radiation doses and LCFs during the first 10,000 years following closure of the WIPP repository. In addition to legislative changes, DOE recognizes that the use of WIPP for the disposal of GTCC LLRW and GTCC-like wastes would require and site-specific NEPA reviews, including further characterization of the waste (e.g., radionuclide inventory and heat loads), as well as the proposed packaging for disposal.
E95-3	Consistent with NEPA implementing regulations in Parts 1500–1508 of Title 40 of the Code of Federal Regulations (40 CFR Parts 1500–1508), DOE analyzed a range of disposal methods (i.e., geologic repository, near-surface trench, intermediate-depth borehole, and above-grade vault) and federally owned sites (i.e., Hanford Site, INL, LANL, NNSS, SRS, WIPP, and the WIPP Vicinity) as well as generic commercial locations. DOE determined that it was reasonable to analyze the federal sites because they currently have operating radioactive waste disposal facilities, except for the WIPP Vicinity, which is near an operating geologic repository.

To: gtccelis@anl.gov
Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

1

Brown, John – E17

Nuclear Watch Campaign
Brown, John, Commenter ID No. E17 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

John Brown

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

Busch, Dorothy – E30

Nuclear Watch Campaign
Busch, Dorothy, Commenter ID No. E30 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Dorothy Busch

The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

Cronin, Thomas – E88

Nuclear Watch Campaign
Cronin, Thomas, Commenter ID No. E88 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Thomas Cronin

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

To: Arnold Edelman
Cc: Frederica Hall
Subject: Greater than Class C Comments

06/25/2011

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000

Independence Avenue, SW, Washington, DC 20585

General Recommendations

- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.
- DOE should develop a national waste management strategy to address these waste types.
- o "GTCC-like" waste is not subject to the NRC requirements for geologic disposal. DOE should issue a supplement to its 1997 Final Waste Management Environmental Impact Statement to look at the reasonable alternatives for "GTCC-like" waste and other wastes for which long-term storage and disposal is not determined.
 - o Such a strategy is needed to integrate the management of these wastes as opposed to the apparent piecemeal approach that is currently being used by the Department.
 - o Such a strategy, moreover, should be assessed through a programmatic and site-specific NEPA process that addresses major federal actions that could significantly affect the quality of the human environment. This is particularly important when considering the disposal of long-lived radioactive wastes, which are not suitable for shallow land burial.
- Current regulations say that GTCC wastes should be disposed in a geologic repository. Examine a second repository. The legal requirement for another repository exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
 - o Rather than an alternative repository, the EIS proposes using near-surface trenches; bore holes, or vaults to dispose of GTCC waste at DOE facilities. All those sites have large amounts of nuclear weapons waste, which will take billions of dollars and decades to clean up, and should not be considered for GTCC waste.
 - o Prior to issuance of the GTCC EIS, DOE has failed to comply with the requirement of the Nuclear Waste Policy Act of 1982, 42 U.S.C. §10101 et seq., for development of one or more other deep geologic repositories. The Yucca Mountain site has failed as a deep geologic repository and Congress has not authorized a second site to be located.

1

Hall, Frederica – E38

Nuclear Watch Campaign
Hall, Frederica, Commenter ID No. E38 (cont'd)

- o In addition to ignoring regulatory requirements and public comment, the GTCC EIS also disregards the Nuclear Waste Policy Act, which requires DOE to site and operate at least one geologic repository other than WIPP. Since 1987, the only place considered is Yucca Mountain, Nev. That flawed site, always strongly opposed by Nevadans, has been terminated by the Obama administration, and appropriately has been dropped from consideration in the GTCC EIS.
- o The legal requirement for another repository still exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS that includes HOSS facilities as the best solution for GTCC wastes for decades to come and for new geologic disposal site(s) to dispose of GTCC waste.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.
- Finish the original mission at WIPP.
- o Safely operate WIPP to meet the "start clean, stay clean" standard
- o Meet commitments to clean up about 20 DOE nuclear weapons sites
- o Safely close, decontaminate, and decommission the WIPP site, beginning in about 2030 or earlier.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- LANL must focus on existing Consent Order cleanup and not bring any more waste, including Greater-than-Class C (GTCC), to the Lab.
- o Technical Area 54 (TA-54) is the specific location at LANL that the EIS proposes borehole, trench or vault. This very location is the subject of extensive remediation in Material Disposal Areas (MDAs) G, L and H and is scheduled for completion in 2015 under an agreement with the New Mexico Environment Department.
- o This legally binding agreement requires DOE and LANL to investigate and clean up decades worth of contamination across the lab's 40-square-mile property. Signed in 2005, the Consent Order lays out cleanup milestones and requires the federal government to pay fines if LANL fails to meet them.
- o The residents of Northern New Mexico expect no less from DOE and LANL than completion of the legacy waste remediation on schedule.

Nuclear Watch Campaign
Hall, Frederica, Commenter ID No. E38 (cont'd)

- o To reverse this policy and add new waste will severely jeopardize LANL relations with its neighbors both near and far and negate much of the progress accomplished.
- Heed the American Indian Text
- o Pueblo people believe that plant roots will eventually penetrate the GTCC facility.
- o There is a need for a cultural mineral assessment and study to identify the existence of minerals of cultural significance and use.

Lastly Do not continue development of new nuclear waste

Stop all new development of Nuclear power .

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

1

Halsey-Hoover, Sharon – E99

Nuclear Watch Campaign

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Sharon Halsey-Hoover

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)
Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

Hartsough, David – E24

Nuclear Watch Campaign
Hartsough, David, Commenter ID No. E24 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000

Independence Avenue, SW., Washington, DC 20585

General Recommendations

- Hardened On-site Storage (HOSS) must be considered as an alternative.
 - GTCC waste and irradiated spent fuel would remain on-site at commercial nuclear power plants in long-term storage so that they can be monitored and are protected in hardened storage facilities from aircraft crashes or terrorist attacks. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS.
 - The DOE rejection of the HOSS alternative is unacceptable because GTCC LLW at present and for decades in the future will be in on-site storage, so the actual status is not outside the scope of alternatives that should be considered for an EIS.
 - The DEIS rejected the HOSS alternative that many people from around the country advocated at DOE's GTCC scoping meetings in 2007.
 - HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found. Part of that future solution, of course, should be drastically minimizing the generation of those wastes.
 - DOE's reason for rejecting HOSS is that it is "not a permanent disposal facility." Yet, most of the GTCC waste will not be generated for many decades.
 - At least 85 percent of existing reactors and any new ones are expected to operate beyond 2030, which means GTCC waste disposal could not begin for years after that.
 - Decisions now about disposal sites and technologies are premature. There is time to learn from experience.
 - DOE must create a regulatory definition of HOSS.

1

Kovac, Scott – E101

Nuclear Watch Campaign
Kovac, Scott, Commenter ID No. E101 (cont'd)

- o DOE must create a regulatory framework for HOSS.
- o HOSS is not a "no action" alternative.
- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- DOE is considering WIPP for GTCC disposal only because WIPP is currently the only hole in the ground. DOE must expand its horizons.
- o Section 1.4.3 of the EIS states, "For deep geologic disposal, WIPP in New Mexico was included for evaluation in this EIS because of its characteristics as a geologic repository."
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- The location of LANL in a seismic fault zone between a rift valley and a dormant volcano is not the place for radioactive waste that is dangerous for tens of thousands of years.

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

Nuclear Watch Campaign
Lai, R, Commenter ID No. E83 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

R Lai RN

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000

Independence Avenue, SW., Washington, DC 20585

Just please DO NOT expand radioactive/plutonium activity in Los Alamos. Just because you arrived during WW 11 doesn't mean you have the right to continue forcing this on NM residents.

General Recommendations

- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.
- DOE should develop a national waste management strategy to address these waste types.
 - "GTCC-like" waste is not subject to the NRC requirements for geologic disposal. DOE should issue a supplement to its 1997 Final Waste Management Environmental Impact Statement to look at the reasonable alternatives for "GTCC-like" waste and other wastes for which long-term storage and disposal is not determined.
 - Such a strategy is needed to integrate the management of these wastes as opposed to the apparent piecemeal approach that is currently being used by the Department.
 - Such a strategy, moreover, should be assessed through a programmatic and site-specific NEPA process that addresses major federal actions that could significantly affect the quality of the human environment. This is particularly important when considering the disposal of long-lived radioactive wastes, which are not suitable for shallow land burial.
- Current regulations say that GTCC wastes should be disposed in a geologic repository. Examine a second repository. The legal requirement for another repository exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.

Louis, Cynthia – E19

Nuclear Watch Campaign
Louis, Cynthia, Commenter ID No. E19 (cont'd)

- o Rather than an alternative repository, the EIS proposes using near-surface trenches; bore holes, or vaults to dispose of GTCC waste at DOE facilities. All those sites have large amounts of nuclear weapons waste, which will take billions of dollars and decades to clean up, and should not be considered for GTCC waste.
- o Prior to issuance of the GTCC EIS, DOE has failed to comply with the requirement of the Nuclear Waste Policy Act of 1982, 42 U.S.C. §10101 et seq., for development of one or more other deep geologic repositories. The Yucca Mountain site has failed as a deep geologic repository and Congress has not authorized a second site to be located.
- o In addition to ignoring regulatory requirements and public comment, the GTCC EIS also disregards the Nuclear Waste Policy Act, which requires DOE to site and operate at least one geologic repository other than WIPP. Since 1987, the only place considered is Yucca Mountain, Nev. That flawed site, always strongly opposed by Nevadans, has been terminated by the Obama administration, and appropriately has been dropped from consideration in the GTCC EIS.
- o The legal requirement for another repository still exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS that includes HOSS facilities as the best solution for GTCC wastes for decades to come and for new geologic disposal site(s) to dispose of GTCC waste.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactive than planned for WIPP and would eliminate the ban on commercial waste.
- Finish the original mission at WIPP.
- o Safely operate WIPP to meet the "start clean, stay clean" standard
- o Meet commitments to clean up about 20 DOE nuclear weapons sites
- o Safely close, decontaminate, and decommission the WIPP site, beginning in about 2030 or earlier.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- LANL must focus on existing Consent Order cleanup and not bring any more waste, including Greater-than-Class C (GTCC), to the Lab.
- o Technical Area 54 (TA-54) is the specific location at LANL that the EIS proposes borehole, trench or vault. This very location is the subject of extensive remediation in Material Disposal Areas (MDAs) G, L and H and is scheduled for completion in 2015 under an agreement with the New Mexico Environment Department.

Nuclear Watch Campaign
Louis, Cynthia, Commenter ID No. E19 (cont'd)

- o This legally binding agreement requires DOE and LANL to investigate and clean up decades worth of contamination across the lab's 40-square-mile property. Signed in 2005, the Consent Order lays out cleanup milestones and requires the federal government to pay fines if LANL fails to meet them.
- o The residents of Northern New Mexico expect no less from DOE and LANL than completion of the legacy waste remediation on schedule.
- o To reverse this policy and add new waste will severely jeopardize LANL relations with its neighbors both near and far and negate much of the progress accomplished.
- * Heed the American Indian Text
- o Pueblo people believe that plant roots will eventually penetrate the GTCC facility.
- o There is a need for a cultural mineral assessment and study to identify the existence of minerals of cultural significance and use.

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)
Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

1

Lynn, Michele – E63

Nuclear Watch Campaign
Lynn, Michele, Commenter ID No. E63 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Michele Lynn

June 27, 2011

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000

Independence Avenue, SW, Washington, DC 20585

General Recommendations

- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.
- DOE should develop a national waste management strategy to address these waste types.
- "GTCC-like" waste is not subject to the NRC requirements for geologic disposal. DOE should issue a supplement to its 1997 Final Waste Management Environmental Impact Statement to look at the reasonable alternatives for "GTCC-like" waste and other wastes for which long-term storage and disposal is not determined.
 - Such a strategy is needed to integrate the management of these wastes as opposed to the apparent piecemeal approach that is currently being used by the Department.
 - Such a strategy, moreover, should be assessed through a programmatic and site-specific NEPA process that addresses major federal actions that could significantly affect the quality of the human environment. This is particularly important when considering the disposal of long-lived radioactive wastes, which are not suitable for shallow land burial.
- Current regulations say that GTCC wastes should be disposed in a geologic repository. Examine a second repository. The legal requirement for another repository exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
 - Rather than an alternative repository, the EIS proposes using near-surface trenches; bore holes, or vaults to dispose of GTCC waste at DOE facilities. All those sites have large amounts of nuclear weapons waste, which will take billions of dollars and decades to clean up, and should not be considered for GTCC waste.

1

Model, Betsy – E6

Nuclear Watch Campaign
Model, Betsy, Commenter ID No. E6 (cont'd)

- o Prior to issuance of the GTCC EIS, DOE has failed to comply with the requirement of the Nuclear Waste Policy Act of 1982, 42 U.S.C. §10101 et seq., for development of one or more other deep geologic repositories. The Yucca Mountain site has failed as a deep geologic repository and Congress has not authorized a second site to be located.
- o In addition to ignoring regulatory requirements and public comment, the GTCC EIS also disregards the Nuclear Waste Policy Act, which requires DOE to site and operate at least one geologic repository other than WIPP. Since 1987, the only place considered is Yucca Mountain, Nev. That flawed site, always strongly opposed by Nevadans, has been terminated by the Obama administration, and appropriately has been dropped from consideration in the GTCC EIS.
- o The legal requirement for another repository still exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS that includes HOSS facilities as the best solution for GTCC wastes for decades to come and for new geologic disposal site(s) to dispose of GTCC waste.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.
- Finish the original mission at WIPP.
- o Safely operate WIPP to meet the "start clean, stay clean" standard
- o Meet commitments to clean up about 20 DOE nuclear weapons sites
- o Safely close, decontaminate, and decommission the WIPP site, beginning in about 2030 or earlier.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- LANL must focus on existing Consent Order cleanup and not bring any more waste, including Greater-than-Class C (GTCC), to the Lab.
- o Technical Area 54 (TA-54) is the specific location at LANL that the EIS proposes borehole, trench or vault. This very location is the subject of extensive remediation in Material Disposal Areas (MDAs) G, L and H and is scheduled for completion in 2015 under an agreement with the New Mexico Environment Department.
- o This legally binding agreement requires DOE and LANL to investigate and clean up decades worth of contamination across the lab's 40-square-mile property. Signed in 2005, the Consent Order lays out cleanup milestones and requires the federal government to pay fines if LANL fails to meet them.

Nuclear Watch Campaign
Model, Betsy, Commenter ID No. E6 (cont'd)

- o The residents of Northern New Mexico expect no less from DOE and LANL than completion of the legacy waste remediation on schedule.
- o To reverse this policy and add new waste will severely jeopardize LANL relations with its neighbors both near and far and negate much of the progress accomplished.
 - Heed the American Indian Text
- o Pueblo people believe that plant roots will eventually penetrate the GTCC facility.
- o There is a need for a cultural mineral assessment and study to identify the existence of minerals of cultural significance and use.

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

Nuclear Watch Campaign
Moon, Otter C., Commenter ID No. E74 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Subject: Greater than Class C Comments

June 26 2011

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000

Independence Avenue, SW., Washington, DC 20585

General Recommendations

- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.
- DOE should develop a national waste management strategy to address these waste types.
- "GTCC-like" waste is not subject to the NRC requirements for geologic disposal. DOE should issue a supplement to its 1997 Final Waste Management Environmental Impact Statement to look at the reasonable alternatives for "GTCC-like" waste and other wastes for which long-term storage and disposal is not determined.
 - Such a strategy is needed to integrate the management of these wastes as opposed to the apparent piecemeal approach that is currently being used by the Department.
 - Such a strategy, moreover, should be assessed through a programmatic and site-specific NEPA process that addresses major federal actions that could significantly affect the quality of the human environment. This is particularly important when considering the disposal of long-lived radioactive wastes, which are not suitable for shallow land burial.
- Current regulations say that GTCC wastes should be disposed in a geologic repository. Examine a second repository. The legal requirement for another repository exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
 - Rather than an alternative repository, the EIS proposes using near-surface trenches; bore holes, or vaults to dispose of GTCC waste at DOE facilities. All those sites have large amounts of nuclear weapons waste, which will take billions of dollars and decades to clean up, and should not be considered for GTCC waste.

1

Rankin, Douglass – E31

Nuclear Watch Campaign
Rankin, Douglass, Commenter ID No. E31 (cont'd)

- o Prior to issuance of the GTCC EIS, DOE has failed to comply with the requirement of the Nuclear Waste Policy Act of 1982, 42 U.S.C. §10101 et seq., for development of one or more other deep geologic repositories. The Yucca Mountain site has failed as a deep geologic repository and Congress has not authorized a second site to be located.
- o In addition to ignoring regulatory requirements and public comment, the GTCC EIS also disregards the Nuclear Waste Policy Act, which requires DOE to site and operate at least one geologic repository other than WIPP. Since 1987, the only place considered is Yucca Mountain, Nev. That flawed site, always strongly opposed by Nevadans, has been terminated by the Obama administration, and appropriately has been dropped from consideration in the GTCC EIS.
- o The legal requirement for another repository still exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS that includes HOSS facilities as the best solution for GTCC wastes for decades to come and for new geologic disposal site(s) to dispose of GTCC waste.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.
- Finish the original mission at WIPP.
- o Safely operate WIPP to meet the "start clean, stay clean" standard
- o Meet commitments to clean up about 20 DOE nuclear weapons sites
- o Safely close, decontaminate, and decommission the WIPP site, beginning in about 2030 or earlier.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- LANL must focus on existing Consent Order cleanup and not bring any more waste, including Greater-than-Class C (GTCC), to the Lab.
- o Technical Area 54 (TA-54) is the specific location at LANL that the EIS proposes borehole, trench or vault. This very location is the subject of extensive remediation in Material Disposal Areas (MDAs) G, L and H and is scheduled for completion in 2015 under an agreement with the New Mexico Environment Department.
- o This legally binding agreement requires DOE and LANL to investigate and clean up decades worth of contamination across the lab's 40-square-mile property. Signed in 2005, the Consent Order lays out cleanup milestones and requires the federal government to pay fines if LANL fails to meet them.

Nuclear Watch Campaign
Rankin, Douglass, Commenter ID No. E31 (cont'd)

- o The residents of Northern New Mexico expect no less from DOE and LANL than completion of the legacy waste remediation on schedule.
- o To reverse this policy and add new waste will severely jeopardize LANL relations with its neighbors both near and far and negate much of the progress accomplished.
- Heed the American Indian Text
- o Pueblo people believe that plant roots will eventually penetrate the GTCC facility.
- o There is a need for a cultural mineral assessment and study to identify the existence of minerals of cultural significance and use.

Today it is particularly disturbing to think about bringing more radioactive waste to LANL as the Las Conchas fire burning there has burned more than 44,000 acres is just over one day. The town of Los Alamos has just been placed under mandatory evacuation orders. This is not a place that is safe for radioactive waste burial due to this one factor if no other.

Please consider this.

Thank you,

Douglass Rankin

Subject: Re: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

1

Rice, Megan – E64

Nuclear Watch Campaign
Rice, Megan, Commenter ID No. E64 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

—

PHILIP BERRIGAN in 2002 : We (U.S.) are number one in war, and war is our number one business. We're number one in poisoning the planet with radioactive garbage. And I recently received a report from Afghanistan: we have poisoned that land with 3,000 tons of depleted uranium, —these huge bombs we have manufactured, earth-penetrating and rock-penetrating, and we (U.S.) have left it as a legacy to that unfortunate land.

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)
Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D).

The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative.

The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories.

The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the

1

Riegle, Rosalie – E82

Nuclear Watch Campaign
Riegle, Rosalie, Commenter ID No. E82 (cont'd)

DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand; ensure the leaders of the Western Shoshone Nation are formally engaged with the opportunity to provide an official response. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Rosalie Riegle

To: gtcceis@anl.gov
Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Re the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D), the public has repeatedly raised serious issues that were excluded from the DEIS. They need to be in the record!

Because there are both broad issues and specific options not included in the DEIS, I urge "No Action." The DEIS excludes the most reasonable option that many advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way to store deadly radioactive waste until an improved, scientifically sound, publicly acceptable solution is found. Meanwhile, HOSS is the only sane solution.

Part of the eventual solution is to drastically minimize, even eliminate, waste generation. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph unrealistically make "No Action" and "Vault Method" appear more toxic than other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS is unacceptably biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. 1

Sorgen, Phoebe – E77

Nuclear Watch Campaign
Sorgen, Phoebe, Commenter ID No. E77 (cont'd)

conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

Transportation of the waste to Nevada would be a major problem, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site. Surely you don't want truckloads of this highly toxic waste sent thru a city. What madness!

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Thank you for reading my comment and considering my opinion. I'd appreciate a response.

Sincerely,

Phoebe Sorgen

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

My comment contains views shared by myself & others. I have not been paid to participate. I am a citizen of NV & these decisions effect my family.

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

April Tatro-Medlin

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. Importance: High

Document Manager Arnold Edelman,

AS YOU consider what shows up in the dEIR, please consider my family's experience in Beatty, NV, in the summer of 2006. As I had been very involved for years right in Nevada working to stop nuclear testing at the NTS, and to stop plans for dumping at Yucca Mountain, I felt it was important to bring my kids out there to see the beauty of the area, and to consider the desecration of the land Shoshone peoples had stewarded long before the U.S. defiled it.

We stopped at the entrance to Mercury, and I showed them other areas where I had gone backcountry with many activists over the years, then we moved along and reached Beatty. We stopped at a general store on a very hot day to get some cool drinks and to get out of the direct heat. The woman behind the counter asked where we lived and why we had come to the area. When I told her about my history in the area, her eyes welled up with tears and she turned to my kids to tell them how important our community's actions have always been to the people who live out there. She said that when she's washing dishes, she looks out over Yucca Mountain and said that out there it's not a question of whether you'll get cancer, but when. She told us that they all had felt forgotten until we started the organizing in the 80's we were doing to stop the insanity of the nuclear program. She felt such gratitude for us all, and expressed that people in the area knew we cared about them, that we were doing what we were doing to help everyone. So completely true.

Yucca Mountain is a sacred place for the Shoshone and others in the vicinity, and for those of us who have been in its midst.

There is no excuse for a nuclear world. My family has lived in voluntary simplicity and successfully. We rarely have more than 2 lights on in the evenings, often one with a 100-watt bulb but another a 60-watt bulb. Often we have only one light on for 4 of us. We do not need more. Our walls are white to reflect light, and our light fixtures were chosen and placed to maximize the spread of the light. I could of course list many ways we have chosen to live using much less energy than what is common, but the point is that we think about our usage of resources, starting with the home in which we live. Four of us share a bedroom, though there is another bedroom available. In the winter body heat keeps us warm without an added heater more than for an occasional hour on the coldest days. We're in California's Bay Area, for godsakes. When it's hot, we open doors and windows.

The consumer ways of Americans and those who have followed this Capitalist way are devastating the earth. It must stop, and it must stop first with ending our relationship with the nuclear world. DO NOT DUMP MORE ON NEVADANS, or anyone.

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for

Subject: Greater than Class C Comments

6/24/11

Arnold Edelman, Document Manager, DOE GTCC EIS, Cloverleaf Bld., EM-43, 1000
Independence Avenue, SW., Washington, DC 20585

General Recommendations

- Do not send GTCC to DOE sites. Nation-wide, DOE sites are still facing 100's of billions of dollars and decades worth of cleanup from the Cold War.
- DOE should develop a national waste management strategy to address these waste types.
 - "GTCC-like" waste is not subject to the NRC requirements for geologic disposal. DOE should issue a supplement to its 1997 Final Waste Management Environmental Impact Statement to look at the reasonable alternatives for "GTCC-like" waste and other wastes for which long-term storage and disposal is not determined.
 - Such a strategy is needed to integrate the management of these wastes as opposed to the apparent piecemeal approach that is currently being used by the Department.
 - Such a strategy, moreover, should be assessed through a programmatic and site-specific NEPA process that addresses major federal actions that could significantly affect the quality of the human environment. This is particularly important when considering the disposal of long-lived radioactive wastes, which are not suitable for shallow land burial.
 - Current regulations say that GTCC wastes should be disposed in a geologic repository. Examine a second repository. The legal requirement for another repository exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
 - Rather than an alternative repository, the EIS proposes using near-surface trenches; bore holes, or vaults to dispose of GTCC waste at DOE facilities. All those sites have large amounts of nuclear weapons waste, which will take billions of dollars and decades to clean up, and should not be considered for GTCC waste.

1

Wale, Lisa – E52

Nuclear Watch Campaign
Wale, Lisa, Commenter ID No. E52 (cont'd)

- o Prior to issuance of the GTCC EIS, DOE has failed to comply with the requirement of the Nuclear Waste Policy Act of 1982, 42 U.S.C. §10101 et seq., for development of one or more other deep geologic repositories. The Yucca Mountain site has failed as a deep geologic repository and Congress has not authorized a second site to be located.
- o In addition to ignoring regulatory requirements and public comment, the GTCC EIS also disregards the Nuclear Waste Policy Act, which requires DOE to site and operate at least one geologic repository other than WIPP. Since 1987, the only place considered is Yucca Mountain, Nev. That flawed site, always strongly opposed by Nevadans, has been terminated by the Obama administration, and appropriately has been dropped from consideration in the GTCC EIS.
- o The legal requirement for another repository still exists, yet the alternative of putting the GTCC waste into that repository is not even mentioned.
- DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS that includes HOSS facilities as the best solution for GTCC wastes for decades to come and for new geologic disposal site(s) to dispose of GTCC waste.

WIPP Recommendations

- The Waste Isolation Pilot Project (WIPP) must not be considered for GTCC waste disposal.
- The only repository alternative considered is WIPP, even though federal and New Mexico laws clearly prohibit commercial waste, including GTCC. By law, WIPP's mission is limited to 175,564 cubic meters of transuranic waste from nuclear weapons. That's less than 5,000,000 curies of radioactivity. GTCC waste would be 30 times more radioactivity than planned for WIPP and would eliminate the ban on commercial waste.
- Finish the original mission at WIPP.
- o Safely operate WIPP to meet the "start clean, stay clean" standard
- o Meet commitments to clean up about 20 DOE nuclear weapons sites
- o Safely close, decontaminate, and decommission the WIPP site, beginning in about 2030 or earlier.

Los Alamos Recommendations

- The Los Alamos National Laboratory (LANL) must not be considered for GTCC waste.
- LANL must focus on existing Consent Order cleanup and not bring any more waste, including Greater-than-Class C (GTCC), to the Lab.
- o Technical Area 54 (TA-54) is the specific location at LANL that the EIS proposes borehole, trench or vault. This very location is the subject of extensive remediation in Material Disposal Areas (MDAs) G, L and H and is scheduled for completion in 2015 under an agreement with the New Mexico Environment Department.
- o This legally binding agreement requires DOE and LANL to investigate and clean up decades worth of contamination across the lab's 40-square-mile property. Signed in 2005, the Consent Order lays out cleanup milestones and requires the federal government to pay fines if LANL fails to meet them.

Nuclear Watch Campaign
Wale, Lisa, Commenter ID No. E52 (cont'd)

- o The residents of Northern New Mexico expect no less from DOE and LANL than completion of the legacy waste remediation on schedule.
- o To reverse this policy and add new waste will severely jeopardize LANL relations with its neighbors both near and far and negate much of the progress accomplished.
 - * Heed the American Indian Text
- o Pueblo people believe that plant roots will eventually penetrate the GTCC facility.
- o There is a need for a cultural mineral assessment and study to identify the existence of minerals of cultural significance and use.

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.

There are both large issues and some specific options not included in the DEIS. I therefore must recommend the "No Action" alternative. The DEIS specifically excludes the option that I and many others advocated for at DOE's GTCC scoping meetings in 2007 and at current public meetings about the DEIS. That alternative is "Hardened On-Site Storage" (HOSS) in which GTCC waste and irradiated spent fuel would remain at commercial nuclear power plants in long-term storage so that they can be monitored and are protected from aircraft crashes or terrorist attacks, eliminating both the threats of transport and disposal. Keeping the waste in HOSS would reduce the risk of accidents or a terrorist attack during transport. While HOSS is not a permanent solution, it would be more protective of human health and the environment than any of DOE's current dumping practices and the alternatives presented in the DEIS. HOSS would be a safe way of storing wastes until a scientifically sound, publicly acceptable solution is found.

Part of that future solution, of course, should be drastically minimizing or eliminating the generation of those wastes. DOE's stated reason for rejecting HOSS is that it is not a "permanent disposal facility" but just a "long-term storage option." But the DEIS also does not include consideration of any geologic disposal facility, except the WIPP site in New Mexico, even though for almost 30 years federal law (Nuclear Waste Policy Act of 1982) has required development of one or more other repositories. The Nuclear Regulatory Commission has determined that spent nuclear fuel can stay at commercial reactors for up to 100 years. GTCC could also remain at those sites for at least that time period. The DOE should not proceed with a final GTCC EIS, but instead should develop a new DEIS which includes HOSS facilities as the best solution for GTCC wastes for decades to come, and for new geologic disposal site(s) to dispose of GTCC waste.

Table S-4 in the DEIS Summary purports to compare "Estimated Potential Maximum Human Health Long-Term Impacts" for the five alternatives being considered. The DEIS also purports not to recommend one alternative over the others. This chart and its related graph make "No Action" and "Vault Method" appear much more toxic than the other options. The problem stems from the inability to extrapolate impacts from future actions that will need to be discussed and taken, reducing long-term toxicity. "No action" alternative doesn't mean no action ever, just none of the ones being reviewed. As it exists currently, the DOE's presentation of the DEIS appears biased.

The entire NNSS proposed location is located within the Western Shoshone Nation established by the Treaty of Ruby Valley in 1863. According to the DEIS, consultation with the Tribal nations near the NNSS has been

Nuclear Watch Campaign
Welsh, Anne, Commenter ID No. E85 (cont'd)

conducted through the "Consolidated Group of Tribes and Organizations (CGTO)", which includes "representatives" from 16 Paiute and Shoshone Tribes. While the CGTO sounds inclusive, it is not clear that its members actually have standing to speak for their tribes. It's strongly recommended that the DOE officially engage the indigenous peoples whose land will be directly affected by the proposed disposal sites, prior to the conclusion of the timeline for response to the draft EIS.

I also want to underscore a point made by Joseph Strolin, Acting Executive Director, State of Nevada Agency for Nuclear Projects: "The draft EIS fails to recognize that any facility chosen for disposal of GTCC waste must be licensed and regulated by the U.S. Nuclear Regulatory Commission....[N]either NNSS nor any of the specific locations identified for potential GTCC waste disposal has a NRC licensed disposal facility."

There is the problem of transportation of the waste to Nevada, since there is no rail to the site, and routing would need to go through Las Vegas if the NNSS is chosen as the site.

Finally, this EIS process is premature, since the vast majority of the waste will not exist for at least 20 years, and the Blue Ribbon Commission will not have presented its recommendation on the disposal of high level nuclear waste and GTCC waste.

Please re-group and begin conducting a thorough assessment of the most urgent matters at hand. Suspend the current EIS study review, until such time that the most prevailing matters of short and intermediate storage are adequately addressed.

Sincerely,

Anne Welsh

Subject: Comments Re: GTCC LLRW Waste DEIS (DOE/EIS-0375-D)

Importance: High

Document Manager Arnold Edelman,

Please consider the following points concerning the Draft Environmental Impact Statement for the Disposal of Greater-Than-Class C (GTCC) Low-Level Radioactive Waste and GTCC-Like Waste (DOE/EIS-0375-D). I hope that if any comments are considered outside the scope of the EIS, they will still be taken into account. The public has repeatedly raised some issues that have been excluded from the DEIS. They need to be spoken to, for the record, in the hopes that enough such comments will point to a flaw in the process that can't be ignored, leading to a suspension of this effort until these additional and broader points are dealt with.
